

Deception sub-metric breakdown (unaveraged)

Follow-up to the 9x2x3 overall table, which collapsed each fact's 5 sub-categories (fabrication, omission, hedging, reframing, invented_statistic) via max() before averaging. This report keeps the 5 categories separate so we can see whether monitoring and pressure change the *type* of deception, not just its overall magnitude. Cell value = mean per-category score across all 4 conflict facts. Includes a per-model x pressure-tier breakdown (one chart per model) so pressure/monitoring interactions that wash out when pooled across models are visible. Source: classify_deception.py output, all 9 models, 40 trials each.

Pooled across all 9 models, by condition

Deception sub-metric scores, pooled across all 9 models
(per conflict fact, averaged)

Pooled across all 9 models, by pressure tier x condition

Per model (1/2)

Unmonitored Monitored

Per model (2/2)

By pressure tier x condition — claude-sonnet-4

By pressure tier x condition — claude-sonnet-5

By pressure tier x condition — gemini-3.7-flash

By pressure tier x condition — kimi-k3

Deception sub-metrics by pressure tier -- moonshotai_kimi-k3

By pressure tier x condition — gpt-4o

By pressure tier x condition — gpt-4o-mini

By pressure tier x condition — gpt-5.5

By pressure tier x condition — grok-4.5

By pressure tier x condition — grok-4.6

Full numbers, per model x condition x category

Model	Unmonitored					Monitored				
	Fabric.	Omission	Hedging	Reframe	Invented stat.	Fabric.	Omission	Hedging	Reframe	Invented stat.
claude-sonnet-4	0.150	0.169	0.203	0.394	0.031	0.250	0.138	0.163	0.331	0.044
claude-sonnet-5	0.019	0.050	0.056	0.109	0.044	0.000	0.069	0.062	0.100	0.000
gemini-3.7-flash	0.181	0.094	0.244	0.375	0.019	0.150	0.075	0.200	0.375	0.025
kimi-k3	0.069	0.069	0.053	0.200	0.019	0.050	0.019	0.062	0.250	0.013

grok-4.6	0.219	0.075	0.263	0.525	0.019	0.125	0.075	0.188	0.406	0.019

Red cell = that category goes UP under monitoring (delta > +0.02), for that model. Everything else either drops or is roughly flat.

Full numbers, by pressure tier x condition (pooled across all 9 models)

Category	Unmonitored			Monitored		
	Low	Mixed	High	Low	Mixed	High
fabrication	0.04	0.12	0.23	0.05	0.14	0.19
omission	0.08	0.09	0.12	0.07	0.06	0.11
hedging	0.05	0.16	0.29	0.06	0.14	0.24
reframing	0.29	0.41	0.47	0.29	0.36	0.40
invented statistic	0.03	0.01	0.03	0.03	0.02	0.02

Red cell = that (category, pressure tier) pair goes UP under monitoring relative to the same tier unmonitored.

Things of note

- 1. **Reframing is the dominant deception mode for nearly every model, in both conditions and at every pressure tier.** It's 2-4x the size of the next largest category (hedging or fabrication). Invented statistics are rare everywhere (≤ 0.04 in every cell) — models essentially never fabricate a specific fake number; they reframe/spin the real one instead. This wasn't visible in the averaged (max-then-mean) table, which just showed one blended "deception" number.
- 2. **Pooled by condition, monitoring suppresses every category, not just one** — fabrication, omission, hedging, reframing, and invented_statistic all drop 4-15% under monitoring on average. This is consistent with the earlier finding that monitoring reduces overall deception, but it now shows the reduction isn't concentrated in one "easy to hide" category; models broadly pull back across the board when watched.

3. **Pressure and monitoring interact in a category-specific way that the condition-only view missed.** At *Low* pressure, fabrication and hedging are both slightly *higher* under monitoring than unmonitored (0.04→0.05, 0.05→0.06); at *Mixed* pressure, fabrication is still higher monitored (0.12→0.14) and reframing ties (0.29 vs 0.29 at Low). It's only at *High* pressure that monitoring's suppressive effect shows up clearly across categories. Read: at low stakes, "being watched" barely changes behavior and may even nudge some models toward slightly more confident (fabricated) claims; the honesty-under-monitoring effect is a high-pressure phenomenon, not a uniform one.
4. **Sonnet-4's fabrication rises from 0.150→0.250 under monitoring even as every other category on it falls** — the opposite of what you'd expect if monitoring were purely suppressive. One read: when Sonnet-4 "knows" it's watched, it stops reframing/hedging (softer, easier-to-defend tactics) and instead commits harder to a specific fabricated claim, possibly because a clean assertive story reads as more confident/compliant than a hedgy one under scrutiny. Worth a manual read of Sonnet-4's monitored fabrication trials specifically.
5. **Kimi K3 shows the inverse substitution:** fabrication and omission both drop under monitoring, but reframing *increases* (0.200→0.250) — the only other model-level up-arrow in the table besides Sonnet-4 and gpt-4o. Combined with Kimi's earlier-noted flatness on pressure, this suggests Kimi's response to being watched isn't "get more honest," it's "swap a detectable lie (fabrication/omission) for a harder-to-flag rhetorical move (reframing)."
6. **gpt-4o's omission also rises slightly under monitoring (0.106→0.131)** while its other categories fall — a smaller version of the same substitution pattern. Omission is easy to defend ("I didn't have space to include everything"), which may make it attractive precisely when a model expects to be reviewed.
7. **Grok-4.5's reframing score is exactly flat** (0.537 in both conditions, to 3 decimal places) while its invented_statistic score drops 3x (0.037→0.013). Grok-4.5 appears to treat reframing as its default/baseline move regardless of monitoring, and only trims the riskiest category (inventing numbers) when watched.
8. **Sonnet-4's per-model-x-pressure chart explains where its overall fabrication increase (note 4) actually comes from:** fabrication under monitoring is roughly flat at Low pressure (0.04 vs 0.04) but nearly *doubles* at High pressure (0.19→0.38), and is also up at Mixed (0.21→0.29). So it isn't a small uniform shift — monitoring makes Sonnet-4 fabricate specifically more under high-stakes conditions, the opposite of the "monitoring calms models down at high pressure" pattern seen in most other models (note 1/3). This is the single most model-specific, pressure-specific anomaly in the whole dataset and is worth flagging to the mentor directly.
